Definition

Demonstration

Conclusions

- Quantum probability amplitudes are not consistent with the axiom of a priori equal probability(at least not on first sight).
- Absence of unitarity in the evolution of thermodynamic systems.
- Further applications.

Definition

Demonstration

Conclusions

- The definition:

$$\rho = \sum_j p_j |\psi_j\rangle \langle \psi_j| \quad (1)$$

- Quantum Randomness vs Classical Randomness:

$$\sum p_j = 1 \quad (2)$$

- The canonical state:

$$\Omega_S = (1 - p)^k \sum_s \exp \left(-\frac{|s|B}{k_B T} \right) |s\rangle \langle s| \propto \exp \left(-\frac{H_S}{k_B T} \right) \quad (3)$$

Assumptions

- Restricted Subspace R

$$\mathcal{H}_R \subseteq \mathcal{H}_S \otimes \mathcal{H}_E \quad (4)$$

- Equiprobable:

$$\mathcal{E}_R = \frac{\mathbb{I}_R}{d_R} \quad (5)$$

- State of the system:

$$\Omega_S = \text{Tr}_E (\mathcal{E}_R) \quad (6)$$

Demonstration

Conclusions

- We compare with a pure state of the Universe.
- Typicality is a naturally statistical equality of an observable in the two cases (i.e. pure or maximally mixed state of the universe):

$$\rho_S = \text{Tr}_E(|\psi\rangle \langle\psi|) \quad (7)$$

- It has been proven that for sufficiently large dimensions of the environment (i.e. possible states):

$$||\rho_S - \Omega_S|| \approx 0 \quad (8)$$

Definition

Demonstration

Conclusions

- There are arguments that the symmetry of envariance can produce Born's rule and Thermal States.
- ψ_{SE} is called envariant under a unitary map $U_S = u_S \otimes \mathbb{I}_E$ iff there exists another unitary $U_E = \mathbb{I}_S \otimes u_E$ such that:

$$\begin{aligned} U_S |\psi_{SE}\rangle &= (u_S \otimes \mathbb{I}_E) |\psi_{SE}\rangle = |\eta_{SE}\rangle \\ U_E |\eta_{SE}\rangle &= (\mathbb{I}_S \otimes u_E) |\eta_{SE}\rangle = |\psi_{SE}\rangle \end{aligned} \tag{9}$$

Conclusions

To illustrate the above we state a simple example. Let \mathcal{S} and E be two level systems and assume that

$$|\psi_{SE}\rangle \propto |\uparrow\rangle_S \otimes |\uparrow\rangle_E + |\downarrow\rangle_S \otimes |\downarrow\rangle_E.$$

$$|\uparrow\rangle_S \otimes |\uparrow\rangle_E + |\downarrow\rangle_S \otimes |\downarrow\rangle_E \xrightarrow{U_S} |\downarrow\rangle_S \otimes |\uparrow\rangle_E + |\uparrow\rangle_S \otimes |\downarrow\rangle_E \quad (10)$$

$$|\downarrow\rangle_S \otimes |\uparrow\rangle_E + |\uparrow\rangle_S \otimes |\downarrow\rangle_E \xrightarrow{U_E} |\downarrow\rangle_S \otimes |\downarrow\rangle_E + |\uparrow\rangle_S \otimes |\uparrow\rangle_E \quad (11)$$

Definition

Demonstration

Conclusions

- Quantum Thermodynamics promises a lot about the foundations of Statistical Mechanics.
- Information Theoretic Approaches are quite convincing and they obviously have something to do with Statistical Mechanics in general.
- Quantum Entanglement is of a vital importance in the production of Statistical Mechanics Formulas via Hilbert Spaces.
